

Home Assignment <1>: Cucumber execution

Learning Objective:

To understand the creation of Cucumber feature step implementation and execution using Cucumber runner.

Expected Completion Time:

Best Case: 25 minutes

Average Case: 30 minutes

Assignment Details:

1. Login to <https://login.salesforce.com>
2. Click on toggle menu button from the left corner
3. Click view All and click Sales from App Launcher
4. Click on Accounts tab
5. Click on New button
6. Enter 'your name' as account name
7. Select Ownership as Public
8. Click save and verify Account name

Requirements for Feature file & StepDefinition:

- Create a package under src/test/java (package name-feature ,steps)
- Create a Feature file
- Create a StepDefinition class under steps Package
- Create separate java methods for each feature steps
- Integrate the methods with steps using cucumber annotation.

Requirements for Cucumber Runner Configuration:

- Create package under src/test/java (package name-runner)
- Create a java class CucumberRunner under runner package
- CucumberRunner extends AbstractTestNGCucumberTests and import io.cucumber.testng.AbstractTestNGCucumberTests
- Apply @CucumberOptions on top of the class and import io.cucumber.testng.CucumberOptions
- Set the attributes to @CucumberOptions with features, glue, monochrome, publish

Hints to Solve:

Creating Step Definition :

- Inside the "steps" package, create a Java class named "StepDefinition." This class will contain the step definitions for your Cucumber scenarios.

Mapping Steps to Step Definitions:

- Each step in the feature file should have a corresponding implementation in the step definition files.
- Use annotations such as @Given, @When, and @Then to map step definitions to the respective steps in the feature file.

Interacting with the Application:

- In StepDefinition Class, write the Selenium Java code that interacts with the application.
- For example, you can use Selenium WebDriver methods to locate elements, perform actions, and make assertions.

Creating the Cucumber Runner:

- Create a RunnerClass extends AbstractTestNGCucumberTests under runner package
- Apply @CucumberOption with

features- path of the feature file

glue- stepDefiniiton class

monochrome- for readable console

publish -report

<https://cucumber.io/docs/cucumber/step-definitions/?lang=java>

Expected Outcome:

By completing this assignment, you should achieve the following outcomes:

Successful Test Execution:

- After running Cucumber tests using the Cucumber runner, you should observe successful test execution.
- The tests should interact with the application as defined in the feature file and step definitions, and any assertions made in the step definitions should pass.

Documentation:

- It will generate test reports that captures the results of test execution.
